Financial Disclosure

This study had funding from PUTI Q1 Grant, Universitas Indonesia (Grant No. NKB-1104) and the Royal Society of Tropical Medicine and Hygiene, United Kingdom (Grant No. 19590206), received by Ahmad Fuady. Tom Wingfield is supported by grants from the Wellcome Trust, UK (209075/Z/17/Z), the Medical Research Council, Department for International Development, and Wellcome Trust (Joint Global Health Trials, MR/V004832/1), and the Medical Research Foundation (Dorothy Temple Cross International Collaboration Research Grant (MRF-131-0006-RG-KHOS-C0942).

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

1 **Abstract**

2 Workers with tuberculosis (TB) are often stigmatized, negatively impacting their
3 socioeconomic position, mental health, and TB treatment outcomes. There is a dearth of
4 validated tools to assess stigma in the worker population. This study aimed to develop and
5 validate a novel, culturally adapted tool to measure TB-related stigma among workers in
6 Indonesia. We translated, adapted, applied, and internally validated Van Rie's TB-Stigma
7 Scale to the worker population in varying sizes businesses (formal and informal business
8 sectors) in Indonesia. Psychometric evaluation using exploratory and confirmatory factor
9 analyses (EFA and CFA) was performed to check the tool's internal consistency and reliability.
10 The translation and cultural adaptation phases resulted in a final 11-item tool. From 172
11 participant responses, the EFA found two loading factors relating to responses on isolation and
12 exclusion from the workplace. The CFA confirmed that the developed model had moderate fit
13 with R^2 values for each item ranging from 0.37 to 0.84. The tool was reliable (Cronbach's alpha
14 0.869). This validated, consistent and reliable adapted tool is ready to use in larger scale
15 evaluations of TB-related stigma amongst workers in formal and informal business sectors of
16 Indonesia to develop strategies to eliminate TB-related stigma from the workplace.

17 **Keywords:** Tuberculosis, stigma, worker, tool, validation, Indonesia.

19 **1. Introduction**

20 Tuberculosis (TB) remains a substantial health problem in Indonesia, with an estimated
21 845,000 TB cases and 92,000 deaths in 2019 (World Health Organization, 2021). These
22 figures, together with the high TB incidence in India, contributed to the significant global
23 increase in TB notifications between 2013 and 2019 (World Health Organization, 2021). The
24 Indonesian government has committed to reducing TB incidence and mortality by 2030, in line
25 with the World Health Organization's 2015 End TB Strategies targets (World Health
26 Organization, 2015). However, efforts to achieve these targets are still hindered by significant
27 challenges, including TB-related stigma (Macintyre et al., 2017; Sommerland et al., 2017).

28 TB-related stigma can negatively affect people's access to TB services, delay treatment,
29 worsen treatment outcomes, and increase the likelihood of TB transmission within families and

30 communities (Datiko et al., 2020). In addition, TB-related stigma can also impact upon
31 people's work life. About 30% of people with TB in Indonesia who have income-earning jobs,
32 either in the formal or informal sector, lose their job because of their illness (Fuady et al.,
33 2018). One of the drivers of job and income loss is stigma and discrimination against people
34 with TB in the workplace. Such stigma can include but is not limited to TB-affected people
35 having limited opportunities to get promotions, being isolated in the workplace, or being
36 dismissed because they are perceived to have higher absenteeism and to be less productive,
37 inefficient, or even burdensome to the enterprise's finances (International Labor Organization,
38 2018; World Health Organization, 2003). As a consequence, people with TB who are
39 stigmatized in their workplace are at risk of facing financial and mental problems, such as
40 anxiety and depression (Stop TB Partnership, 2019). Therefore, assessing stigma towards
41 workers with TB is essential to understand TB-related stigma prevalence and determinants in
42 the workplace and develop stigma-reduction strategies, policies, and legislation.

43 There have been several tools to assess TB-related stigma (Stop TB Partnership, 2019), but
44 most are those applied to people with TB, the general population, and healthcare workers who
45 care for people with TB (Nuttall et al., 2022). Van Rie's TB-Stigma scale is one of the most
46 used and adapted tools to assess TB-related stigma (Bergman et al., 2021; Van Rie et al., 2008).
47 **(See Appendix – Table S1)** The Van Rie scale has two forms covering both community and
48 patient perspectives toward TB, which address TB-Stigma comprehensively. The items in the
49 scale can capture the types of stigma: (a) enacted or experienced stigma—the range of
50 behaviours directly experienced by people with TB, (b) anticipated stigma—fear of negative
51 behaviour of others towards people, and (c) internalised (or self) stigma—acceptance of
52 negative stereotypes about people with TB. Identifying these types of stigma guides to finding
53 key causes of stigma, such as fear of transmission, keeping distance from affected individuals,
54 and moral values of blame, responsibility, guilt, and punishment) (Stop TB Partnership, 2019;
55 Van Rie et al., 2008).

56 To date, there has been no specific tool used to measure stigma towards fellow coworkers in
57 workplaces and, according to our previous review, no intervention developed to address TB-
58 stigma in this specific population (Nuttall et al., 2022). TB-Stigma in the workplace can
59 develop in different ways from the stigma development in the general community, even in
60 healthcare workers' settings. They work in more intense working hours, often in indoor settings,
61 leading to increased fear of infection, stigmatisation, and discrimination. In addition to the fear

62 of transmission, the stigma in the workplace may develop from a productivity loss perspective.
63 Some questions asked to the general population, for example, “Some people do not want those
64 with TB playing with their children”, are irrelevant for workers and need adjustment. For these
65 reasons, this study aimed to cross-culturally adapt Van Rie’s TB-Stigma Scale in order to
66 develop and validate a new tool to measure TB-stigma among workers in Indonesia. This study
67 was a part of our larger work in developing a tool to measure TB-stigma and the psychosocial
68 impact of TB among people with TB and their households in Indonesia (Fuady et al., 2022).

69

70 **2. Materials and Methods**

71 We performed the study in three phases between February and July 2022: Phase 1—
72 Translation, Phase 2—Cross-cultural adaptation, and Phase 3—Psychometric evaluation. We
73 conducted Phase 1 in two weeks, followed by Phase 2 in three months and Phase 3 in two
74 months (one-month of data collection and one-month of data analysis). (Figure 1)

75 **2.1. Instrument**

76 There is no tool, questionnaire, or scale to measure TB-stigma among workers in non-
77 healthcare settings. We decided to adapt Van Rie’s Stigma Scale which originally consisted of
78 two parts: Part A: Community Perspectives towards TB (11 items); and Part B: Patient
79 Perspectives towards TB (12 items). We used Part A for adaptation and validation in the
80 general worker population on the assumption that in settings outside of healthcare this
81 population would be similar to community respondents. Each of the 11 items in Part A of the
82 Van Rie Stigma Scale has four options: strongly disagree (0), disagree (1), agree (2), and
83 strongly agree (3) (Van Rie et al., 2008).

84

--FIGURE 1 HERE--

85 **2.2. Phase 1: Translation**

86 The original Van Rie’s TB-Stigma scale was translated into Bahasa, the lingua franca of
87 Indonesia. Two independent researchers (FG, TS) fluent in English and Bahasa with previous
88 experience in TB research did the translation separately, resulting in two versions of translated
89 scales. The study team reconciled the two translated versions into one version, which was
90 consolidated before the back translation. The consolidated version was then translated back to

91 English by a contracted translator who was separate from the project team and did not know
92 the original version of the tool. The adapted, back-translated English tool was subsequently
93 reviewed and compared with the original tool by the study team to check for readability and
94 consistency.

95 **2.3. Phase 2: Cross-cultural adaptation**

96 We adapted the tool to the Indonesian context by (a) inviting local experts to a two-stage panel
97 meeting and (b) pre-testing the tool prior to deployment. We purposively selected and invited
98 thirteen experts with diverse but complementary experience: three occupational medicine
99 specialists, three community medicine specialists, a psychiatrist, a psychologist, two
100 pulmonologists, the Indonesian National TB Program, and two TB-related non-government
101 organizations. Ten experts joined the first stage panel meeting. In this meeting, we invited
102 suggestions from participants on the content and language of the tool in order to be culturally
103 appropriate to the Indonesian context. Since there was no previous tool specific to the worker
104 population, experts were invited to suggest additional items or delete items (resulting a Pre-
105 final Tool 1). We invited the same experts to the second panel meeting. In this meeting, six
106 experts provided further comments or suggestions to the Pre-final Tool 1 to shape the tool (Pre-
107 final Tool 2). All panel expert meetings were recorded, and experts verbally consented at the
108 beginning of the meetings.

109 We subsequently further revised the tool and sent to the panel experts to reach a version of the
110 tool ready for pilot implementation (resulting in a Pilot Tool). We then did a cognitive
111 debriefing by pre-testing the tool with 20 respondents in three enterprises in formal sector and
112 one enterprise in informal sector, following the International Society for Pharmacoeconomics
113 and Outcomes Research (ISPOR) guidance (Wild et al., 2005). The four enterprises were the
114 enterprises included in this study. For the debriefing, we selected workers from different
115 divisions of groups than those included in Phase 3. We deployed the tools in two forms but
116 identical contents: online (developed in the RedCap platform) and paper-based, both of which
117 were self-administered. We asked the respondents to check whether the statement items were
118 straightforward, unambiguous, and not misinterpreted. We also asked respondents' opinions
119 on the content and language used in the tool and its appropriateness to the Indonesian cultural
120 context. The study team discussed all inputs from the cognitive debriefing, did proofreading
121 and finalized the tool for the psychometric evaluation.

122 **2.4. Phase 3: Psychometric evaluation.**

123 *2.4.1. Participant selection and sample size*

124 For a psychometric evaluation, we first purposefully selected several enterprises in four
125 provinces: East Java, West Java, Banten and Jakarta. We divided the enterprises into formal
126 (medium to large size, more than 50 employees, and formally registered with the Ministry of
127 Investment/Indonesian Investment Coordinating Board) and informal (small size, less than 50
128 employees, and not formally registered with the Ministry of Investment/Indonesian Investment
129 Coordinating Board) business sectors. The enterprises in the formal sector were manufacturing,
130 wholesale and service enterprises. The small enterprises in the informal sector were the home
131 industry of bag makers, bakers, home chip makers, and local farmers. At each enterprise, we
132 contacted the human resource department (formal sector) and the owner (informal sector) to
133 select division(s) or group(s) of workers aged ≥ 18 years old. We calculated the sample size
134 based on the original study's Cronbach's Alpha of 0.9 (Fuady et al., 2022) and assumed a
135 Cronbach's Alpha of 0.85 in this study. With an alpha of 5% and power of 80%, we required
136 at least 146 respondents (Bujang et al., 2018).

137 We also asked demographic characteristics of respondents, including sex, marital status,
138 education level, workplace setting (indoor or outdoor), job level (high, middle, low), and their
139 monthly income according to the Indonesian National Statistics Bureau's (grouped to three: <
140 IDR 3.5 million [USD239], IDR 3-7.5 million [USD240-477] and > IDR 7.5 million
141 [USD478]).

142 *2.4.2. Data collection and statistical analyses*

143 We developed self-administered paper-based and online tools to allow flexibility in data
144 collection. The online tool was developed using RedCap (--link is hidden for blind review--)
145 by FAH and AF. All tools were provided with a complete written explanation about the study
146 and informed consent. Investigator (FAH) answered, clarified, and explained any questions
147 from respondents regarding the tool.

148 We deployed an online-based tool to all workers in selected divisions/groups appointed by
149 enterprise managers. The response rate was evaluated every two days, and if no response had
150 been received, a same-day online message (i.e., WhatsApp messenger) was sent to remind
151 invitees to fill out the tool. After seven days, we ended the data collection, assuming that we

152 would not receive responses following three consecutive reminders. For enterprises in which
153 online-based data collection were not possible, we deployed paper-based tool to the workers.
154 All responses from the paper-based tool were entered into the RedCap platform (REDCap). All
155 data were exported to IBM SPSS version 26 for data cleaning, validation, and analyses (IBM
156 Corp, 2019).

157 **2.4.3. Internal consistency**

158 We performed Exploratory Factor Analysis (EFA) to assess the internal consistency of the tool.
159 In the Principal Axis Factor analysis, we set a threshold of 0.7 for Kaiser-Meyer-Olkin's
160 (KMO) and 0.05 for Bartlett's test values. We followed the analyses with factor analysis by
161 assessing the Eigenvalues to determine the number of factors or domains. We included factors
162 with Eigenvalues >1 and contained three or more items with a loading of ≥ 0.4 (Bujang et al.,
163 2018).

164 We applied a confirmatory factor analysis (CFA) and evaluated the model by calculating Root
165 Mean Square Error of Approximation (RSMEA), Standardized Root Mean Square Residual
166 (SRMR), Comparative Fit Index (CFI) and Tucker-Lewis Index (TLI). RSMEA value of less
167 than 0.05 is considered as fit, while the value of 0.05-0.08 is a reasonable fit. CFI and TFI of
168 more than 0.90 and SRMR of less than 0.08 were set as thresholds of model fitness. We also
169 tested the reliability by assessing Cronbach's Alpha, with a Cronbach's Alpha coefficient of
170 0.80-0.90 being considered reliable (Bujang et al., 2018). CFA was done using the lavaan
171 package in R.

172 **2.5. Ethics**

173 This study received ethical approval from (--information is hidden for blind peer review--) We
174 provided information about the study to all respondents before they provided a consent to join
175 the study, either by clicking "Agree" in electronic tool or signing in paper-based tool.

176 **2.6. Reporting**

177 Throughout the delivery and reporting of the study, we followed the guidance developed by
178 ISPOR [17].

179

180 3. Results

181 3.1. Phase 1: Translation

182 The study team proposed four main changes in translating and consolidating the tool. First,
183 changing the subject in all statements, from "some people" to "I" because of the first-person
184 perspective. In the original tool, people with TB were asked how they perceive the community's
185 attitude toward them or people with TB. In this study, we asked workers about their attitudes
186 toward people with TB so that using "I" is more relevant, contextual, and understandable.
187 Second, we proposed the additional wording "coworkers" to replace "friends". These two
188 changes reflected different perspectives from the original version—for example, from "Some
189 people may not want to eat or drink with friends who have TB" to "I do not want to eat or drink
190 with coworkers who have TB." Third, we proposed to delete one item, "Some people may not
191 want to eat or drink with relatives who have TB" because it was not relevant for workers in
192 their workplaces. Fourth, we proposed two additional items to explore whether people with TB
193 were stigmatized in the workplace due to the perception that they were detrimental to their
194 enterprise (see **Appendix, Table S2**):

- 195 1. I think that coworkers with TB have limited capacity to work (*Saya berpikir bahwa rekan*
196 *kerja lain yang mengalami tuberkulosis memiliki kinerja yang terbatas*)
- 197 2. I think that coworkers with TB negatively impact the enterprise's finances (*Saya berpikir*
198 *bahwa rekan kerja lain yang mengalami tuberkulosis merugikan perusahaan*)

199 These four changes were discussed at the expert panel meetings.

200 3.2. Phase 2: Cross-cultural adaptation

201 All proposed changes were agreed upon in the first stage of the expert panel meeting (February
202 2022). In addition, one item, "I keep my distance from coworkers with TB" (adapted from the
203 original item of 'Some people keep their distance from people with TB'), was deleted because
204 this item was represented by other items about keeping distancing, for example, 'do not want
205 to eat or drink with coworkers with TB', 'feel uncomfortable around coworkers with TB', and
206 'behave differently around coworkers with TB'. This first stage panel meeting resulted in 11
207 items (Pre-final Tool 1). In the second stage (May 2022), there were no additional or deleted
208 items, but some suggestions on the use of specific words, for example, changing 'disgusting'
209 to 'shameful' and 'afraid' to 'worry' for better understanding (See Appendix, Table S1).

210 In a cognitive debriefing, we deployed the Pilot Tool with 20 respondents representing those
 211 working in formal and informal sectors. All respondents filled in all items in the tool. When
 212 asked about the clarity of the tool, all respondents reported that the items were clearly
 213 understood. However, they suggested a few wording changes to improve the tool's clarity (See
 214 Appendix, Table S1). For the online-based tool, no technical issues (e.g., items not displayed
 215 correctly, missing items, unable to click the answer) were identified. There was no difference
 216 in interpretation between those filling out the online and the paper-based tool. No further
 217 substantial changes were made to the tool after this stage.

218 3.3. Phase 3: Psychometric evaluation

219 We received 242 responses from the online tool and 96 responses from the paper-based tool.
 220 Of 242 online responses, 137 (56.6%) decided not to join the study, and 29 (11.9%) did not
 221 complete the tool. All responses from the paper-based tool were complete. Therefore, we
 222 entered 172 responses into the analysis.

223 Of 172 respondents, most were female (56%), married (68%), low-level staff (55%), worked
 224 in formal sectors (78%) and indoor settings (76%), and had low to moderate monthly income
 225 (< IDR3.5million [USD239], 52.3%) (**Table 1**). Most of the respondents (78%) were aware of
 226 TB. Thirty respondents had previously known coworkers who had been diagnosed with TB.
 227 Thirty-four respondents recognized that at least one person, either their coworker or someone
 228 outside their workplace, was rejected from their community or workplace due to being
 229 diagnosed with TB.

230

231 **Table 1.** Respondents' characteristics (n=172)

Characteristics	n	%
Sex		
Male	72	41.9
Female	100	58.1
Marriage status		
Single	39	22.7
Married	119	69.2
Widowed	14	8.1
Education level		
No schooling	3	1.7
Primary schooling	63	36.6

High school	66	38.4
College/University	40	23.3
Business sectors		
Formal sector	131	198.7
Informal sector	41	1.2
Workplace setting		
Indoor	137	79.7
Outdoor	35	20.3
Job level		
High (Director, Manager)	12	7.0
Middle (Supervisor)	22	12.8
Low (Staff, operator)	98	57.0
N/A (informal sector)	40	23.3
Monthly income		
< IDR3.5million (USD239)	90	52.3
IDR3.5-7.5m (USD240-477)	55	32.0
> IDR7.5m (USD478)	22	12.8
Prefer not to say	5	2.9
Previously diagnosed with TB		
Yes	6	3.5
No	166	96.5
Experience of coworkers or other people with TB		
Aware of TB	134	77.9
Has known coworkers with TB	30	17.4
Recognized people with TB (either coworkers or people outside workplace) who were rejected from workplace/community	34	19.8

232

233 3.4 Internal consistency

234 EFA of the 11-item adapted stigma tool gave a KMO value of 0.871 and a Bartlett's test value
 235 of 967.295 ($p < 0.001$). Following on from these findings, further analysis identified two loading
 236 factors: isolation (V1, 2, 3, 4, and 5) and exclusion from the workplace (V6, 7, 8, 9, 10, and
 237 11) (**Table 2**). The tool was reliable, with a Cronbach's alpha of 0.869.

238 **Table 2.** Loading factors of each tool item

Items	Factor		Mean	Cronbach 's Alpha if Item Deleted
	1	2		

V1 I do not want to eat or drink with coworkers with TB	0.553		1.92	0.867
V2 I feel uncomfortable about being near coworkers with TB	0.766		1.79	0.847
V3 I do not want to talk to coworkers with TB	0.610		1.42	0.859
V4 I try not to touch coworkers with TB	0.688		1.62	0.852
V5 I am worried about being infected by a coworker with TB	0.666		1.98	0.854
V6 I would behave differently towards coworkers with TB		0.464	1.15	0.861
V7 I do not want someone with TB working in my department/division/working room	0.510	0.538	1.61	0.849
V8 I think that a coworker with TB should be ashamed	0.422	0.466	1.31	0.857
V9 I think that a coworker with TB should be fired from his/her position		0.469	1.03	0.865
V10 I think that a coworker with TB has a more limited capacity to work than a coworker without TB		0.71	1.44	0.865
V11 I think that coworkers with TB can negatively impact the enterprise/workplace		0.72	1.17	0.859
Overall Cronbach's Alpha				0.869

239 In the CFA, we found that the scaled (robust) chi-square for our model was $X^2(pdf) = 105.58$
 240 (43), which was statistically significant ($p < 0.05$, Figure 2). The RMSEA value was 0.092,
 241 indicating that the model was reasonably fit, and we continued to further analysis. The SRMR
 242 was 0.061, with CFI of 0.910 and TLI of 0.885, showing the model was a reasonable fit. The
 243 R^2 values for each item ranged from 0.37 to 0.84.

244 --FIGURE 2 HERE--

245 4. Discussion

246 We culturally adapted Van Rie's TB-Stigma Scale to develop a new TB-stigma tool to be
 247 applied to the worker population in Indonesia. The tool was considered comprehensive, had
 248 good content validity and internal consistency, and included some adapted and additional items
 249 relevant to the worker population.

250 This is the first tool developed to measure TB-Stigma among the non-healthcare worker
 251 population. This suggests that, despite people with TB anecdotally reporting stigmatization and
 252 discrimination in the workplace (Islam et al., 2015; Thu et al., 2012), such stigma is rarely

253 measured and related legislation to protect workers with TB or symptoms of TB remains a
254 neglected area (Stop TB Partnership, 2019). Two previous studies developed tools to measure
255 TB-related stigma specific to healthcare workers in other countries (Sommerland et al., 2020;
256 Wu et al., 2009). Some items used in these tools are similar to those used in the newly adapted
257 tool. For example, "I do not want to work together with coworkers who have tuberculosis", "I
258 am afraid of coworkers with tuberculosis", and "I do not want to eat or drink in the same room
259 as a coworker who has tuberculosis" (Wouters et al., 2017; Wouters et al., 2016) However, our
260 tool was more comprehensive and was shown to have better consistency and validation.

261 Adaptation and validation of the tool followed the ISPOR's guidelines for adapting a tool to a
262 new context. The experts involved in this study were medical specialists, psychologists, and
263 professionals who work with people with TB, all of whom were well-informed on how stigma
264 can develop in workplaces. Their involvement, alongside the participation of both formal and
265 informal sector workers, also helped to refine the tool by formulating appropriate item wording
266 from multiple diverse perspectives, adding, and deleting items to be more relevant to the
267 context, and ensuring that every statement was understandable for the target population.

268 In adapting to a new context and population, we decided to ask the respondents items to
269 consider in the first person "I" as opposed to third person "some people". Using the third
270 person's perspective is generally applied to ask sensitive questions. In this context, besides
271 improving the respondents' understanding of the statement, it was vital to capture their personal
272 perceptions towards people with TB. We also replaced 'people with TB' with 'coworkers with
273 TB' to highlight that the stigma being assessed was towards their coworkers.

274 The EFA showed two main factors running throughout the 11 items: isolation and exclusion
275 from the workplace. These two factors are similar and may even intersect. However, isolation
276 indicates perception and attitudes towards coworkers with TB who continue to work in the
277 workplace. Conversely, exclusion from the workplace is a perception that coworkers with TB
278 negatively impact the workplace and, therefore, should be excluded.

279 These two factors are helpful in identifying the roots of TB-Stigma in working place and how
280 to tackle it. Isolation may be closely related to the misconception of TB development, spread,
281 infection, and risk. Therefore, improving TB-related knowledge would significantly reduce
282 TB-Stigma when the TB-related scores in this factor are high. Exclusion from the workplace
283 may be related misconception of to the effects of TB. Workers with TB, especially those

284 seeking care, may have impaired health, higher absenteeism, and, therefore, may be assumed to
285 be less productive or even costly for the enterprise. Enterprise managers may also not
286 understand that people with pulmonary TB are generally non-infectious after 14 days of
287 appropriate anti-TB therapy and therefore should be able to return to work after proper
288 assessment. When the score is high for this ‘isolation’ factor, improving the perception of TB
289 early detection, prompt treatment, evaluation, and enabling non-punitive sick leave is essential,
290 particularly for those in a high-level position in the enterprise. Stronger legislation and social
291 protection for those living with TB are also imperative to protect them from unnecessary job
292 and income loss.

293 Two statements were added to this tool to capture exclusion from the workplace, “I think that
294 coworkers with TB have limited capacity to work” and “I think that coworkers with TB
295 negatively impact the enterprise’s finances”. These statements showed relatively high loading
296 factor values and were shown to be valid, internally consistent, reliable, and contributed to the
297 overall internal consistency and reliability of the tool. These statements are also critical since
298 TB-Stigma related to these statements can create health inequality for the stigmatized group.
299 TB-Stigma, in this case, tends to keep people away (disease avoidance). In the workplace,
300 stigmatization from the more powerful group (superintendent, manager, owner) to the less
301 powerful group will create inequality in socioeconomic and health (Hatzenbuehler et al., 2013).

302 Despite the valuable findings, this study has several limitations. First, the respondents were
303 those working on Java Island, which is characterised as a densely populated urban area with
304 good access to information, including online information. The tool may not be generalizable
305 to other areas including rural regions. Indonesia also has a wide variety of cultures that may
306 affect the interpretation of question items and findings. Therefore, the items will need to be
307 reviewed and refined prior to any wider implementation. Checking the wording and verifying
308 the understanding of the statements among target respondents would help to optimize
309 consistent and valid responses in future deployment. Second, the participation bias resulting
310 from the high rejection rate among respondents receiving online tools may underestimate or
311 overestimate the findings. Almost all respondents rejecting to join the study left the tool on its
312 first page. We did not provide questions to explore the reasons for rejection, which can also be
313 ethically problematic data to collect. Third, the proportion of respondents from the high-level
314 position was low. Although we could assess the stigma related to exclusion from the workplace,

315 it may not necessarily capture such stigma among males and those in a high-level position, who
 316 have more power to decide workers' employment status (Islam et al., 2015).

317 5. Conclusions

318 We successfully adapted Van Rie's TB-Stigma Scale into a tool to measure TB-Stigma
 319 amongst working people in Indonesia. The adapted tool is valid, internally consistent, reliable,
 320 and ready for wider external validation among workers in both formal and informal business
 321 sectors in Indonesia and beyond. Our identification of isolation and exclusion from the
 322 workplace as two significant loading factors may support the design and development of
 323 interventions, policies, and legislation to address the root causes of TB-Stigma in the
 324 workplace.

404 **Appendix**405 **Table S1.** Original TB-Stigma Scale by Van Rie *et al.* (2008)

Tuberculosis-related stigma scale items				
I. Community perspectives toward tuberculosis				
<i>Instructions: From now on, I shall read the statements, which explain about how your community feels towards people with TB. After I read each statement, please answer whether you agree or disagree that such events occur in your community. If you agree, I will ask how you agree, agree or strongly agree. If you disagree, I will ask how you disagree, disagree or strongly disagree. You can refuse to answer any questions that make you feel uncomfortable.</i>				
Items	Strongly Disagree	Disagree	Agree	Strongly Agree
1. Some people prefer not to have those with TB living in their community	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Some people keep their distance from people with TB	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Some people think that those with TB are disgusting	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Some people feel uncomfortable about being near those with TB	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Some people do not want those with TB playing with their children	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Some people do not want to talk to others with TB	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. If a person has TB, some community members will behave differently towards that person for the rest of his/her life	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Some people may not want to eat or drink with friends who have TB	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. Some people try not to touch others with TB	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10. Some people may not want to eat or drink with relatives who have TB	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
11. Some people are afraid of those with TB	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
II. Patient perspectives toward tuberculosis				
<i>Instructions: From now on, I shall read the statements, which explain about how people with TB feel. After I read each statement, please answer whether you agree or disagree that TB patients in your community feel like that. If you agree, I will ask how you agree, agree or strongly agree. If you disagree, I will ask how you disagree, disagree or strongly disagree. You can refuse to answer any questions that make you feel uncomfortable.</i>				
Items	Strongly Disagree	Disagree	Agree	Strongly Agree
1. Some people who have TB feel guilty because their family has the burden of caring for them	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

2. Some people who have TB keep their distance from others to avoid spreading TB germs	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Some people who have TB feel alone	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Some people who have TB feel hurt of how others react to knowing they have TB	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Some people who have TB lose friends when they share with them they have TB	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Some people who have TB are worried about having AIDS	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Some people who have TB are afraid to tell those outside their family that they have TB	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Some people who have TB will choose carefully who they tell about having TB	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. Some people who have TB are afraid of going to TB clinics because other people may see them there	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10. Some people who have TB are afraid to tell their family that they have TB	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
11. Some people who have TB are afraid to tell others that they have TB because others may think that they also have AIDS	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
12. Some people who have TB feel guilty for getting TB because of their smoking, drinking, or other careless behaviors	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

406

407

408 **Table S2.** Transcultural Adaptation and Modification of the TB-Stigma Tool

No	Original Version	Tool Draft 1	Pre-final Tool 1	Pre-final Tool 2	Pilot Tool
1	Some people may not want to eat or drink with friends who have TB	<i>Saya tidak ingin makan atau minum dengan rekan kerja yang mengalami tuberkulosis</i>	<i>Saya tidak mau makan atau minum bersama dengan rekan kerja lain yang mengalami tuberkulosis / TB / TBC</i>	<i>Saya tidak berkenan makan atau minum bersama dengan rekan kerja lain yang mengalami tuberkulosis / TB / TBC</i>	<i>Saya tidak berkenan makan atau minum bersama dengan rekan kerja lain yang mengalami tuberkulosis / TB / TBC</i>
2	Some people feel uncomfortable about being near those with TB	<i>Saya merasa tidak nyaman berdekatan dengan rekan kerja yang mengalami tuberkulosis</i>	<i>Saya merasa tidak nyaman berdekatan dengan rekan kerja lain yang mengalami tuberkulosis / TB / TBC</i>	<i>Saya merasa tidak nyaman berdekatan dengan rekan kerja lain yang mengalami tuberkulosis / TB / TBC</i>	<i>Saya merasa tidak nyaman berdekatan dengan rekan kerja lain yang mengalami tuberkulosis / TB / TBC</i>
3	If a person has TB, some community members will behave differently towards that person for the rest of his/her life	<i>Jika rekan kerja di tempat kerja saya mengalami tuberkulosis, saya akan berperilaku berbeda terhadapnya di tempat kerja dibandingkan sebelumnya</i>	<i>Jika rekan kerja di tempat kerja saya mengalami tuberkulosis / TB / TBC, saya akan bersikap berbeda terhadap orang tersebut dibandingkan sebelumnya.</i>	<i>Saya akan bersikap berbeda pada rekan kerja yang di diagnosis tuberkulosis / TB / TBC</i>	<i>Saya akan bersikap berbeda pada rekan kerja yang di diagnosis tuberkulosis / TB / TBC</i>
4	Some people do not want those with TB playing with their children	<i>Saya tidak ingin seseorang yang mengalami tuberkulosis bekerja atau ditempatkan di departemen atau divisi saya</i>	<i>Saya tidak mau ada seseorang yang mengalami tuberkulosis / TB / TBC bekerja atau ditempatkan di departemen atau divisi saya</i>	<i>Saya tidak mau ada seseorang yang mengalami tuberkulosis / TB / TBC bekerja atau ditempatkan di departemen atau divisi saya</i>	<i>Saya tidak mau ada seseorang yang mengalami tuberkulosis / TB / TBC bekerja atau ditempatkan di departemen / divisi / ruang kerja saya</i>
5	Some people keep their distance from people with TB	<i>Saya menjaga jarak dengan orang yang mengalami tuberkulosis di tempat kerja</i>	This statement is deleted because other statement has already captured any signs of distancing.	-	-

6	Some people think that those with TB are disgusting	<i>Saya berpikir bahwa rekan kerja yang mengalami tuberkulosis itu menjijikkan</i>	Menurut saya, rekan kerja yang mengalami tuberkulosis / TB / TBC itu menjijikkan	<i>Menurut saya, rekan kerja yang mengalami tuberkulosis / TB / TBC itu aib atau hal yang memalukan</i>	<i>Menurut saya, rekan kerja yang mengalami tuberkulosis / TB / TBC itu aib atau hal yang memalukan</i>
7	Some people do not want to talk to others with TB	<i>Saya tidak ingin berbicara dengan rekan kerja yang mengalami tuberkulosis</i>	<i>Saya tidak mau berbicara dengan rekan kerja yang mengalami tuberkulosis / TB / TBC</i>	<i>Saya tidak berkenan berbicara dengan rekan kerja yang mengalami tuberkulosis / TB / TBC</i>	<i>Saya tidak berkenan berbicara dengan rekan kerja yang mengalami tuberkulosis / TB / TBC</i>
8	Some people are afraid of those with TB	<i>Saya takut terhadap rekan kerja yang mengalami tuberkulosis</i>	<i>Saya takut tertular dengan rekan kerja lain yang mengalami tuberkulosis / TB / TBC</i>	<i>Saya khawatir tertular dengan rekan kerja lain yang mengalami tuberkulosis / TB / TBC</i>	<i>Saya khawatir tertular dengan rekan kerja lain yang mengalami tuberkulosis / TB / TBC</i>
9	Some people try not to touch others with TB	<i>Saya berusaha tidak bersentuhan dengan rekan kerja yang mengalami tuberkulosis</i>	<i>Saya berusaha tidak bersentuhan dengan rekan kerja lain yang mengalami tuberkulosis / TB / TBC</i>	<i>Saya berusaha tidak bersentuhan dengan rekan kerja lain yang mengalami tuberkulosis / TB / TBC</i>	<i>Saya berusaha tidak bersentuhan dengan rekan kerja lain yang mengalami tuberkulosis / TB / TBC</i>
10	Some people may not want to eat or drink with relatives who have TB	Not relevant in working place	-	-	-
11	Some people prefer not to have those with TB living in their community	<i>Saya berpikir bahwa rekan kerja yang mengalami tuberkulosis harus dihentikan dari pekerjaannya</i>	Menurut saya, rekan kerja lain yang mengalami tuberkulosis / TB / TBC harus dipecat dari pekerjaannya	<i>Menurut saya, rekan kerja lain yang mengalami tuberkulosis / TB / TBC sebaiknya dihentikan dari pekerjaannya</i>	<i>Menurut saya, rekan kerja lain yang mengalami tuberkulosis / TB / TBC sebaiknya dihentikan dari pekerjaannya</i>
Added items:					
12		<i>Saya berpikir bahwa rekan kerja lain yang mengalami tuberkulosis</i>	<i>Saya berpikir bahwa rekan kerja lain yang mengalami tuberkulosis / TB / TBC</i>	<i>Saya berpendapat bahwa rekan kerja lain yang mengalami tuberkulosis /</i>	<i>Saya berpendapat bahwa rekan kerja lain yang mengalami tuberkulosis /</i>

		<i>memiliki kinerja yang terbatas</i>	<i>akan memiliki kemampuan kerja yang terbatas.</i>	<i>TB / TBC akan memiliki kemampuan kerja yang terbatas.</i>	<i>TB / TBC pasti akan memiliki kemampuan kerja yang terbatas.</i>
13		<i>Saya berpikir bahwa rekan kerja lain yang mengalami tuberkulosis merugikan perusahaan</i>	<i>Saya berpikir bahwa rekan kerja lain yang mengalami tuberkulosis / TB / TBC dapat merugikan perusahaan</i>	<i>Saya berpendapat bahwa rekan kerja lain yang mengalami tuberkulosis / TB / TBC dapat merugikan perusahaan</i>	<i>Saya berpendapat bahwa rekan kerja lain yang mengalami tuberkulosis / TB / TBC dapat merugikan perusahaan / tempat kerja</i>

Acknowledgments

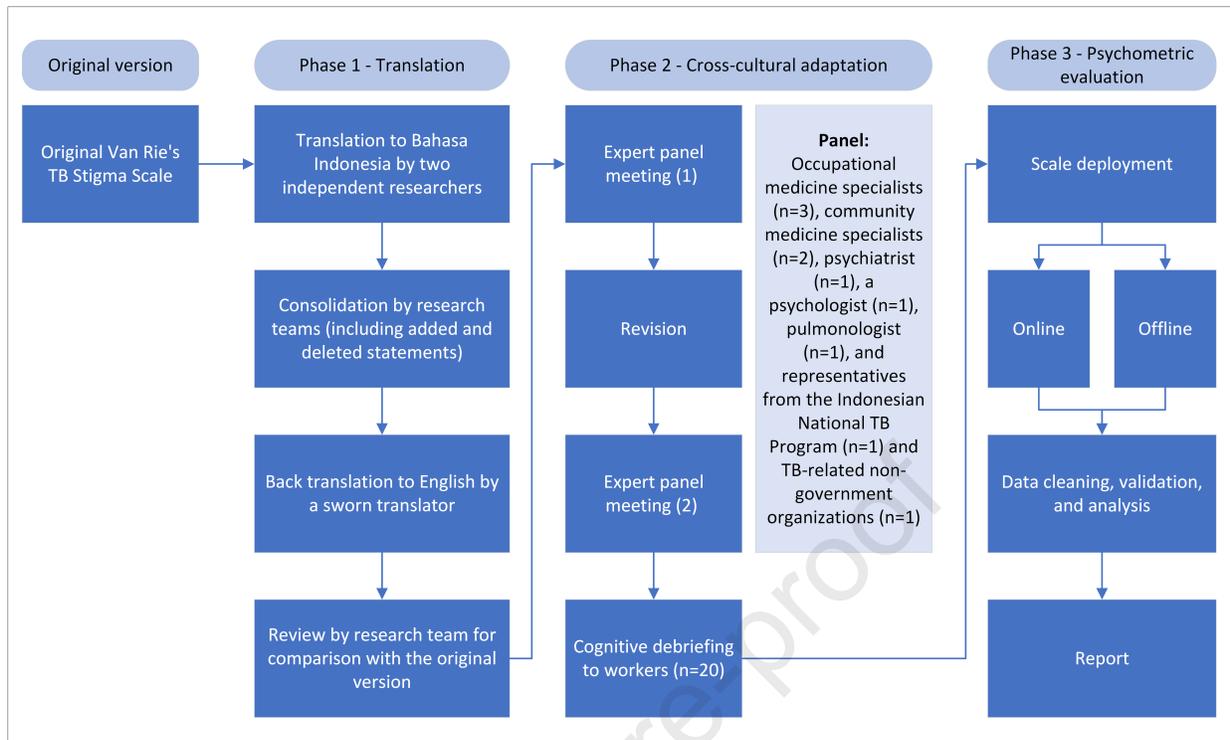

Funding: This study had funding from PUTI Q1 Grant, Universitas Indonesia (Grant No. NKB-1104) and the Royal Society of Tropical Medicine and Hygiene, United Kingdom (Grant No. 19590206). TW is supported by grants from the Wellcome Trust, UK (209075/Z/17/Z), the Medical Research Council, Department for International Development, and Wellcome Trust (Joint Global Health Trials, MR/V004832/1), and the Medical Research Foundation (Dorothy Temple Cross International Collaboration Research Grant (MRF-131-0006-RG-KHOS-C0942)).

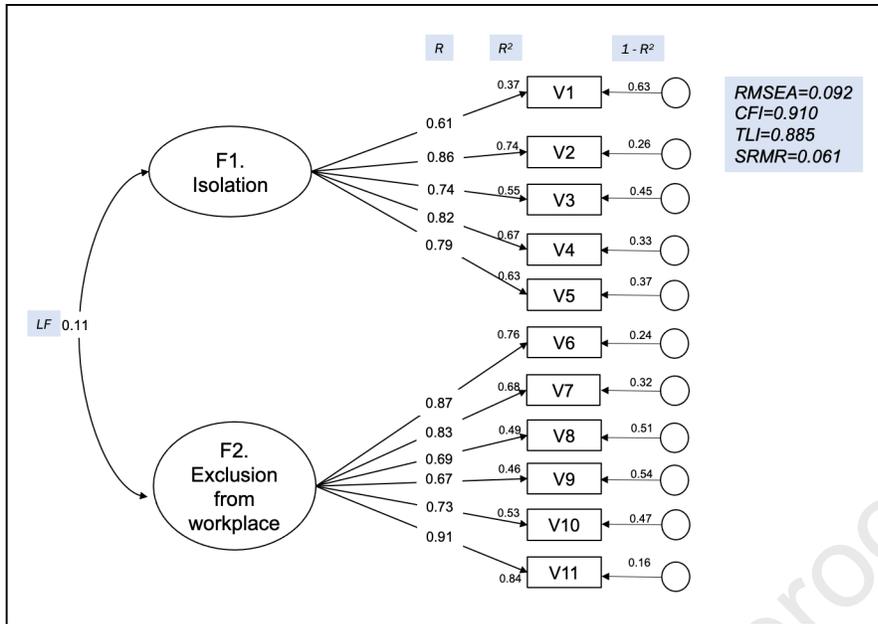

Institutional Review Board Statement: The Ethical Committee of Medicine, University of Indonesia approved this study with the ethical approval number KEP – 60 / UN2.F1/ETIK/PPM.00.02/2022 and protocol number 22-01-0023.

Informed Consent Statement: Informed consent was given to each respondent in this study. Respondents were also informed that they could resign or refuse if they were unwilling to participate in the study. In addition, they were informed that all information provided would be kept confidential.

Data Availability Statement: The data set used and analyzed in this study is available from the authors who were asked to respond with a reasonable request.

Acknowledgments: We thank Annelies Van Rie and Aaron Kipp who allowed us to validate their original scale to Indonesian setting. We also thank Fajri Gafar and Trisasi Lestari for translating the original scale to Indonesian; Bustanul Arifin and Saidah Rauf for critical input to the translation; Risatianti Kolopaking, Feranindhya Agiananda, Diah Handayani, Bonnie Medana Pahlavie, Angelin Yuvensia, and Indonesian National TB Program officers for joining the expert panel and providing insightful comments; and all staffs in the Study Master Program of Occupational Medicine, Universitas Indonesia and Association of Alumni of Study Master Program of Occupational Medicine, Universitas Indonesia for supporting the implementation of this study. We thank the owners and staff of all companies who participated in and supported this study.

Highlights

- This is the first tool to measure stigma towards people with tuberculosis, developed for the general worker population.
- The tool was adapted from Van Rie's TB Stigma Scale with some adjustments and additional statements relevant to the worker population.
- The tool is valid, consistent, reliable, and ready to use in larger-scale evaluations of TB-related stigma amongst workers in formal and informal business sectors of Indonesia. It can be translated and culturally adapted to other settings or countries.
